# ABSTRACT

With the increasing of the population and revolution of the new technologies, Blood Unity management plays an important role in the blood unity as blood is the necessity to everyone. This proposed system of the Blood Unity is a web-based system intends to simplify and automate the process of searching for blood in case of emergency and maintain the records of blood donors, recipients, blood donation programs and blood stocks in the bank. Through the manual system of keeping the blood donation records, it is quite difficult to maintain the details of the donors and their donations as reference because the data can be lost or redundant. In case of critical blood demand in one time, broadcasting the message should be done to all donors with the respected blood group. The proposed of Blood Unity helps the people who are in need of a blood by giving them all details of blood group availability or regarding the donors with the same blood group. A blood unity needs to maintain almost hundred of records every day and therefore with computer system it can become more fast and accurate. It will also enable to search the details when required. The proposed project is an ultimate solution of the problem regarding collection, storage and usage of blood in a blood unity. It makes the blood donation and withdrawing system go through a scientific and systematic way. Using this system, one can inquire the availability of blood type and amount in a blood unity easily.

# **ACKNOWLEDGEMENT**

**We are very glad to present this project "Blood Unity"**

**We take this opportunity to express our gratitude to many people, whose good wishes and positive approach have inspired us to take this project as success. However, it is imperative for us to mention some of them who played significant role in my project.**

# DECLARATION

We here by declaring that the project entitled, " **Blood Unity**" has not been any case duplicated to submit to any other university for the award of any degree. To the best of my knowledge other than me, no one has submitted to any other university.

# INTRODUCTION

The project **Blood Unity** system is designed for the blood bank to gather blood from various sources and distribute it. The Software is designed to handle the daily transaction of the blood unity and search the details when required. It also helps to register the details of donors, blood collection details as well as blood issued reports. The software application is designed in such a manner that it can suit the needs of all the blood unity requirements in the course of future. It will help us to find the blood group with its most efficient time to take care of the blood and it is more easy to hand over the blood to the hospital to help people to get blood on time.

This all things is been stored and been seen in this blood unity. Blood Unity is a browser based solution that is designed to store, process, retrieve and analyze information concerned with the administrative, inventory management and clinical aspects of providing services within a blood unity.

The application allows the users to store the donor details in the application itself. Any subsequent donations made by the same donor automatically got linked up with the same identification number.

System allows the user to store physical and medical details of the donor at the time of the registration which could later on be edited during the time of subsequent donations. Application also allows the users to check the eligibility criteria of the donors for making donations, depending on which a track of the referred donors can be kept for the future referrals.

# Features & functionality of the Blood Unity website

There are three main actors of the application who will interact directly with the application. **Admin, Donors, User.**

## **Admin:**

Admin can manage both donors & users. He can add or remove any user from the system. Each member in a donor & user is given a user id and password, which identifies him uniquely. From admin module use can change donor details, delete donor or change the password.

1. · Change Password
2. · Modify donor details
3. · Delete donor details
4. Handle blood requests.

## **Donor:**

Each member in a donor & user is given a user id and password, which identifies him uniquely. Every registered donor has some option which will be showing in their account.

1. Login
2. Update your information
3. Delete account
4. Log Out.

## Used Tools and Technologies

**Technology/Domain:** Java

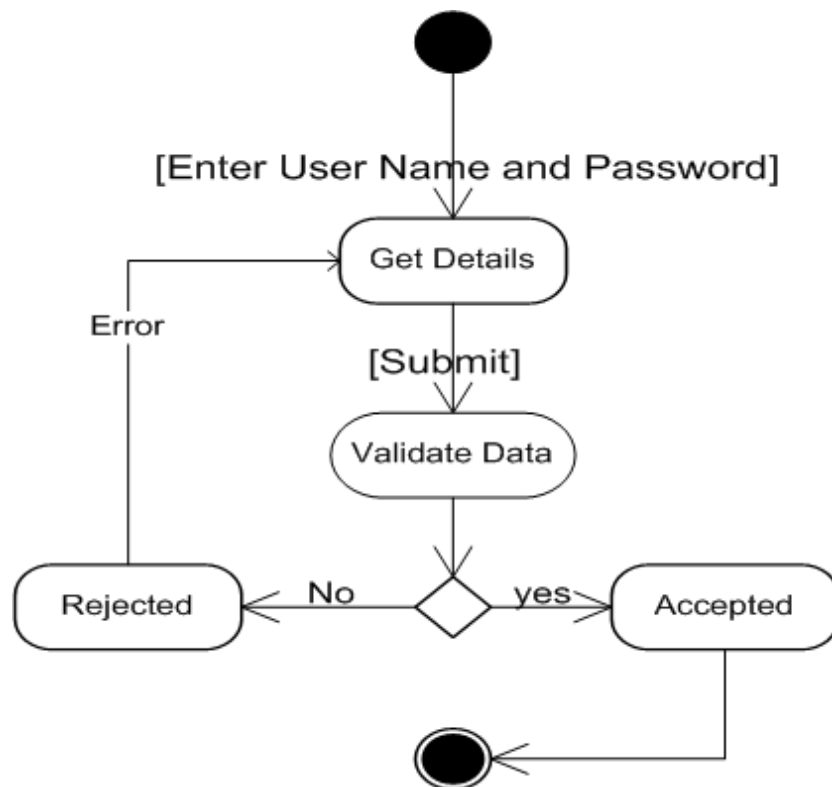

**Front-End:** Angular

**Back-end:** JAVA Springboot

# CONCLUSION

This proposed Blood Unity gives a reliable platform for both donors and users. It helps to minimize the human errors and problems related to data redundancy. The database is a vital aspect of the system.

The Blood Unity aims to automate the entire process of blood donation and management, making it more efficient, cost-effective, and error-free. The system will ensure the safety of the blood supply chain by implementing robust screening and testing protocols.

# FUTURE WORK

The Blood Unity has the potential for further development and improvement some future aspects of the project include:

1. Automated Blood Group Detection: You can add a feature to detect the blood group of a donor using their phone camera, which will make the donation process more efficient.
2. Mobile App Integration: You can integrate the web app with a mobile app to enable donors and volunteers to access the blood bank's services from their smartphones.
3. Analytics and Reporting: You can add a feature to generate reports and analyze the data collected by the web app to identify areas for improvement.
4. Social Media Integration: You can integrate the web app with social media platforms to raise awareness about blood donation and the services provided by the blood unity.
